The heart of these new Systems, the SprayThru™ (ST) Barrel, allows solution to be sprayed directly inside the barrel. This provides not only a better solution exchange, but also maintains a higher level of concentrated solution **inside** the barrel throughout the plating cycle.

Furthermore, the ST™ Barrel incorporates all the standard Hardwood efficiency features such as: I/O Doors, exterior machined pockets, interior striations and 1" thick panels.

The ST™ Barrel is designed to be used throughout all the stations of your plating line. When it is coupled with the specially designed ST™ plating tank the result is a maximum efficiency plating station. Retrofit kits enable you to utilize the ST™ barrel with any of your existing tanks.

When the ST™ Barrel is integrated with the patented RinseMaster™ counterflow spray rinsing system the result is a highly efficient, water conserving, space saving rinse station, combining the effectiveness of a 7 tank rinse in one single station.

Please call to find out how SprayThru™ technology can improve your efficiency.
